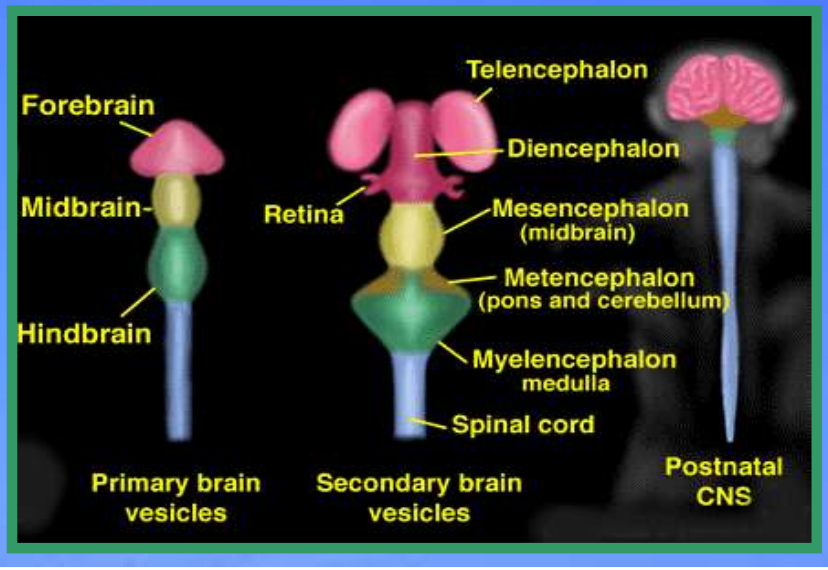
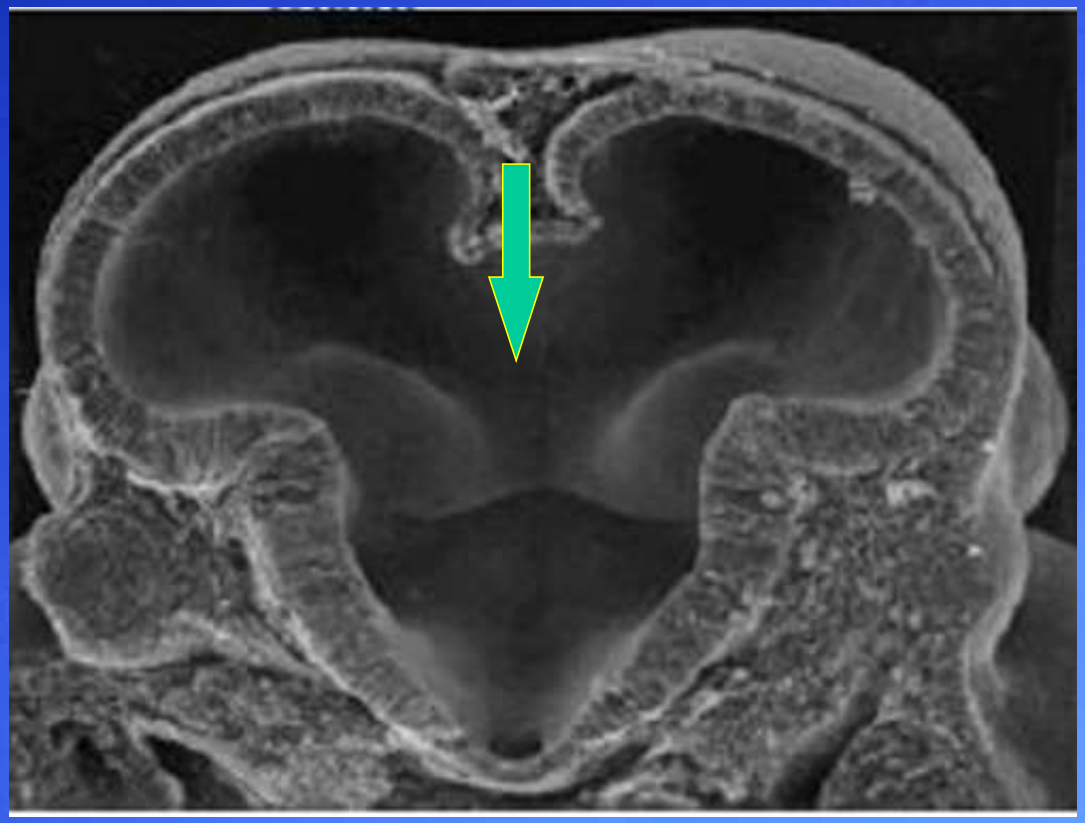
COMPLETAMENTO INDUZIONE VENTRALE

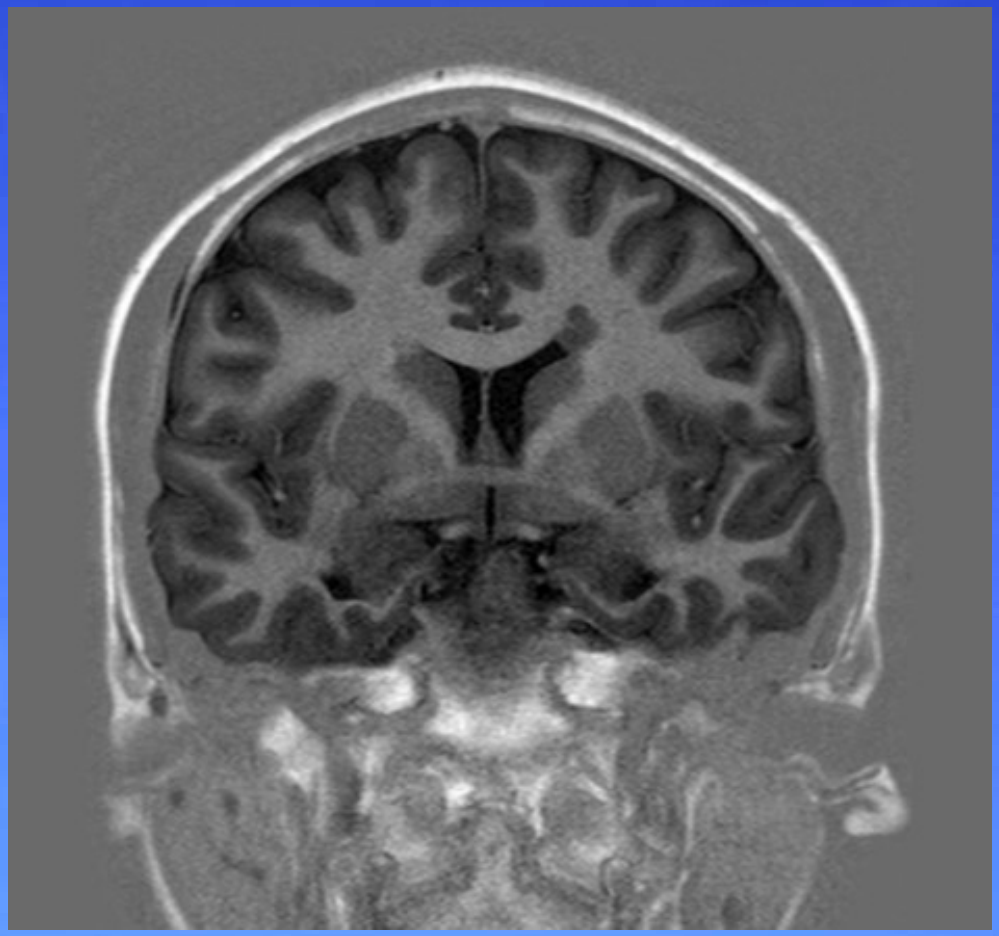
- Primi movimenti spontanei
- Narici e punta del naso sviluppati
- Si delineano le dita dei pied
- Membrana anale perforata
- Membrane urogenitali differenziate
- Testicoli ed ovaie distinguibili



OLOPROSOENCEFALIA

- *Anomalia della induzione ventrale 25-29 gg (4 settimane)*
- *Il prosencefalo non da luogo al clivaggio in due emisferi*
- Si forma un ventricolo unico centrale fuso col terzo
- Da ipotelorismo a ciclopia
- Possibile assenza dell'ipofisi
- Frequente nelle trisomie





Fenotipi

Gravi

- Sinoftalmia
- Ciclopia
- Proboscide
- Cebocefalia (singola narice appiattita)
- Assenza di tratti riconoscibili

Lievi

- Labiopalatoschisi
- Ipoplasia mediofacciale
- Ipotelorismo
- Incisivo centrale unico

- Assenza del frenulo labiale superiore
- Incisivo unico
- Ipotelorismo
- Coloboma dell’iride,

Oloprosoencefalia	alobare	semilobare	lobare
Anomalie faciali	+ 83%	30% (labiopalatoschisi bila) ipertelorismo	minori o assenti

Zellweger spectrum disorders (ZSDs) are rare, debilitating genetic diseases of peroxisome biogenesis that require constant management and lifelong care. Nevertheless, the experience of family caregivers for children diagnosed with ZSD is not well understood. In this study, we sought to characterize the emotional experience of ZSD family caregivers. Three 90-min focus groups were conducted with thirty-seven parents (25 mothers and 12 fathers) of children with ZSD during a family advocacy conference. Focus groups were arranged by age of proband (Group 1: 0–4 years, Group 2: 5–10 years, Group 3: > 11 years). Audio recordings of focus groups were transcribed and analyzed using software for coding purposes. Analyzed content was validated using peer debriefing, member checking, and method triangulation. Focus group results showed that nearly a third of ZSD caregivers described their overall emotional experience as a "rollercoaster." Additionally, three interconnected themes were identified: 1) range of emotions, 2) stressors, and 3) coping. Feeling overwhelmed and devastated were the most frequently described emotional responses. Corresponding stressors to these emotions included the burden of caregiver tasks associated with ZSD, and negative interactions with healthcare professionals. The most common coping strategies were acceptance of limitations of the diseases, redefining "normal" in the parenting experience, and advocating on behalf of the child and the patient community. This study underscores the profound emotional impact on parents who are caregivers for children with ZSDs, highlighting the utility of patient community feedback and qualitative approaches to fully characterize the overall family experience. Simple, targeted approaches focusing on improved communication between healthcare professionals and families, as well as offering resources for emotional support may greatly improve the lives of families living with ZSD and other rare pediatric diseases.

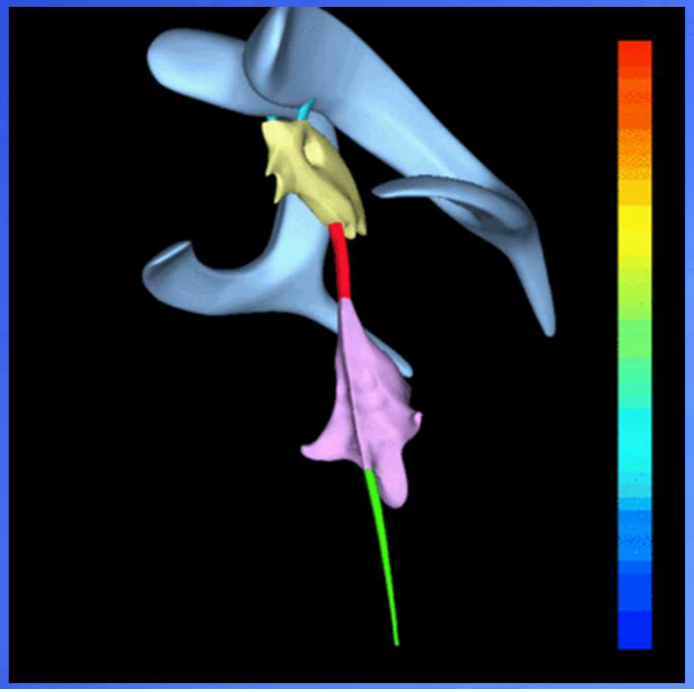
Approccio ACT

- **6 sett**
- **Comparsa del sistema ventricolare**
  spazi subaracnoidei
- 13 sett definizione del ventricolo laterale
- 21 sett fessura corioidea
- 32 sett striato



7 sett.

- Occhi localizzati ai lati della testa
- Orecchie basso impianto
- Intestino inizia a migrare verso l'embrione all'interno del cordone ombelicale
- Dita delle mani si allungano
- Le mani posturalmente si uniscono sull'addome
- Piedi palmati

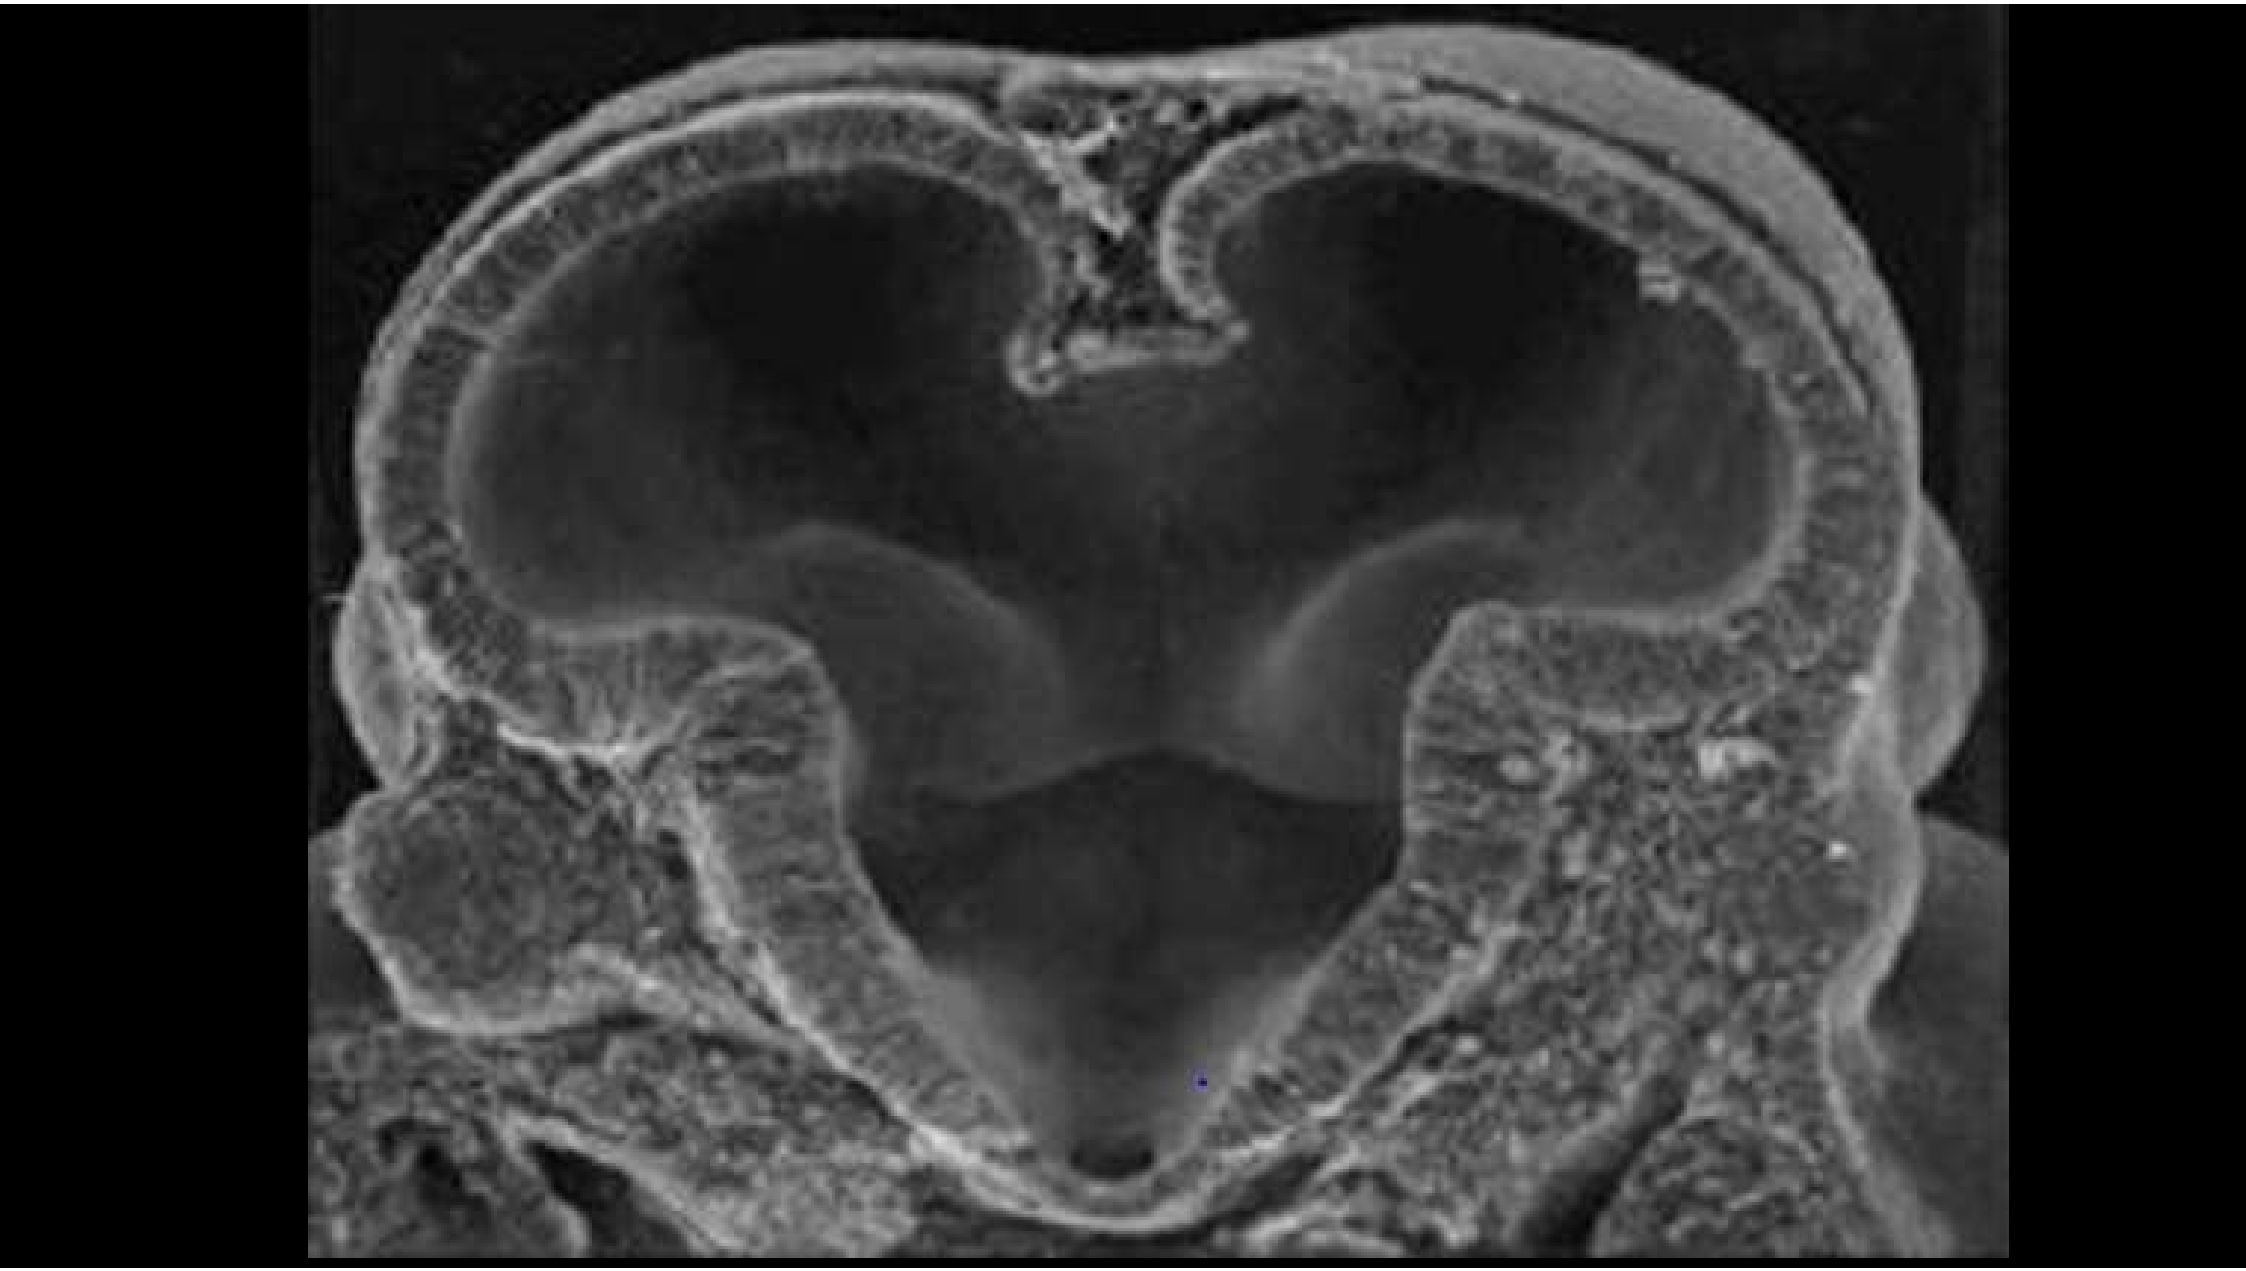
8 settimane

- Testa eretta e di forma rotonda
- Orecchie esterne sviluppate.
- Occhi chiusi, ma la retina è pigmentata
- Le palpebre cominciano a chiudersi.
- Si formano le papille gustative sulla lingua
- Inizio della fusione delle ossa del palato
- Si riconoscono le dita mani e piedi
- L'ectoderma è sostituito da un sottile strato di pelle

56-57 gg

12 sett- 3 mesi

- 2-4 mesi difetti della proliferazione neuronale
- 3-5 mesi difetti della migrazione neuronale



Proliferazione neuronale 2-4 mesi

- Tutti i neuroni e la glia derivano dalle zone germinative subependimali presenti nel S.N.C.
- Le unità proliferative sono prodotte da divisioni simmetriche delle cellule staminali
- Successivamente le unità proliferative aumentano per divisioni asimmetriche delle cellule prima della migrazione neuronale

- Sono presenti 2 ondate proliferative
  - a) neuronale 2-4 mese
  - b) gliale 5→ 12 mesi di vita ed oltre
- Una parte della proliferazione gliale ha luogo nel 1° periodo per dare origine alla glia radiale che è coinvolta nella migrazione neuronale
- Oltre al 4° mese la proliferazione coinvolge principalmente cellule dello strato granulare del cervelletto e dell' ippocampo
- La proliferazione segue un modello "va e vieni" «migrazione nucleare intercinetica»

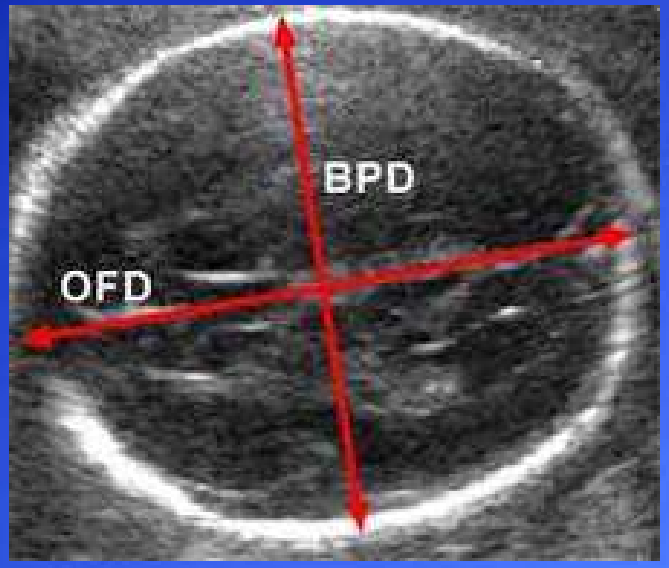
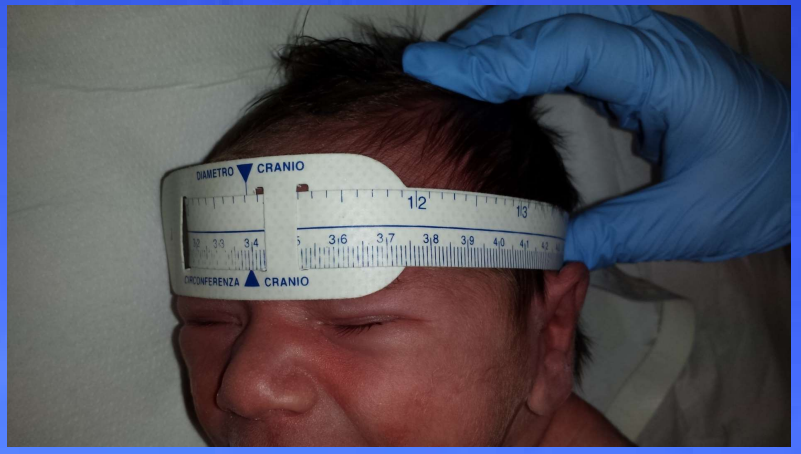
La circonferenza cranica





La c.c. reale andrebbe misurata con craniometro e non metro da sarta!

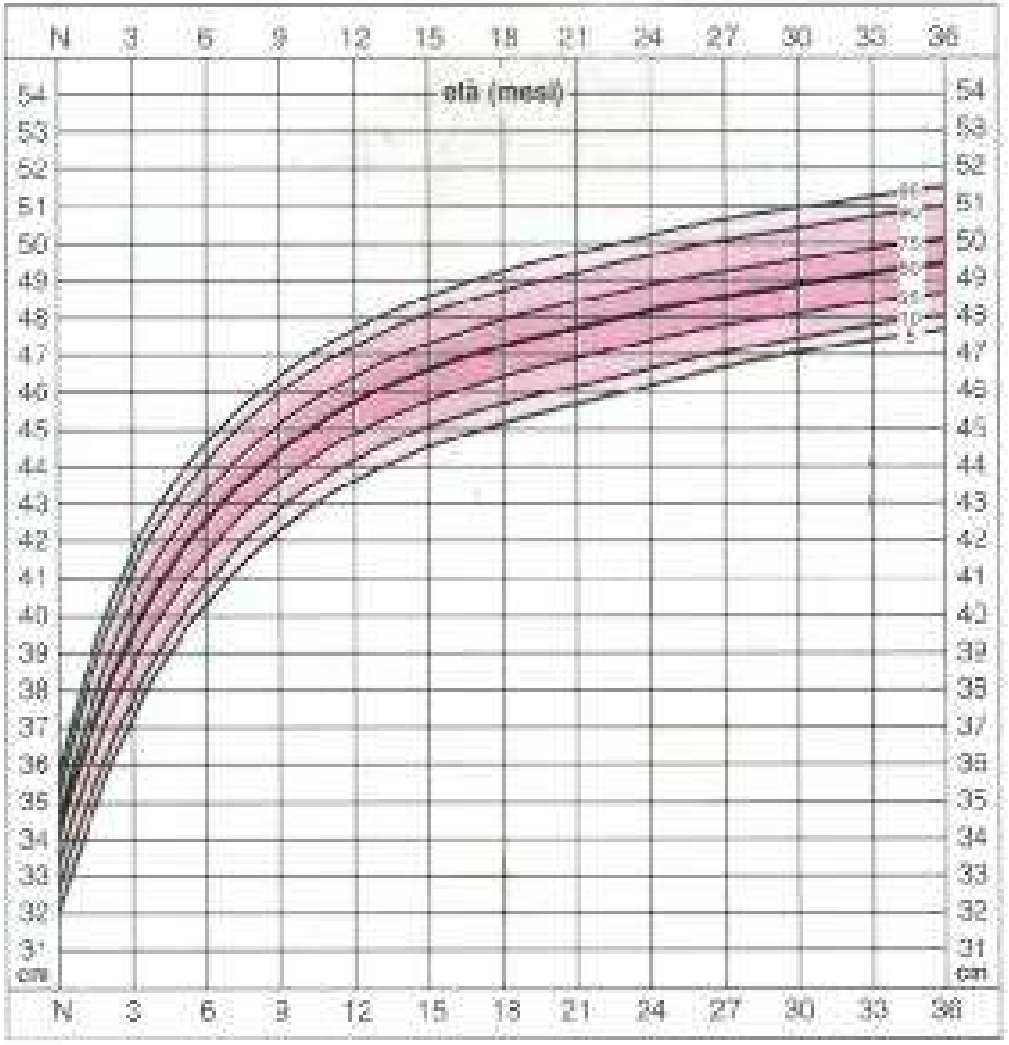
Il valore più attendibile è a 72 ore (eventualmente alla dimissione) soprattutto se in nato da parto spontaneo e con impegno prolungato della parte presentata

Si dovrebbe fare una media di 3 misurazione consecutive

Altrimenti rischio di falso positivo per microcefalia elevato

Basarsi sempre sulla eventuale familiarità per il follow-up

Idem per le macrocefalie, che potrebbero slatentizzarsi nelle ore successive al parto (falso negativo)



età (mesi)

Microcefalia Ipotesi:

- Anomalie cromosomiche
- Sindromi genetiche
- Tossine /virus → precoce differenziazione ependima→ arresto della attività mitotica del neuroepitelio telencefalico
- Irradiazione (4-20 seg)
- Farmaci (cortisone,aminopterina)
- Iperfenilalanimemia materna

Approccio clinico

- Definire la entità in DS e non centili
- Familiarità
- Reperto isolato o in un quadro sospetto per patologia genetica, infettiva prenatale
- Presente alla nascita o esordio successivo
- Anamnesi gravidica, perinatale e post natale
- Imaging prenatale e neonatale (tutti i neonati microcranici dovrebbero eseguire eco-doppler cerebrale)
- Compromissione organi di senso
- Presenza di segni neurologici-ritardo dello sviluppo-Disabilità intellettiva

MICROCEFALIA

- **1. Congenital**

- Isolated
- Familial (Autosomal recessive) microcephaly
- Autosomal Dominant microcephaly
- X-linked microcephaly
- Chromosomal (balanced rearrangements & Ring chromosome)

- Syndromes

- Chromosomal
- Down syndrome
- Edward Syndrome
- Patau Syndrome
- Unbalanced rearrangements
- Contiguous gene deletion
- 4p deletion (Wolf–Hirschhorn syndrome)
- 5p deletion (Cri-du-chat)
- 7q11.23 deletion (Williams syndrome)
- 22q11 deletion (DiGeorge syndrome)
- Single gene defects
- Smith–Lemli–Opitz syndrome
- Seckel syndrome
- Cornelia de Lange syndrome
- Holoprosencephaly

- Acquired
  - Disruptive injuries
    - Ischemic stroke
    - Hemorrhagic stroke
  - Death of a monozygotic twin
  - Congenital Infections
    - Congenital cytomegalovirus infection
    - Toxoplasmosis
    - Congenital rubella syndrome
  - Drugs
    - Fetal hydantoin syndrome
    - Fetal alcohol syndrome
  - Other
    - Radiation exposure to mother
    - Maternal Malnutrition
    - Maternal Phenylketonuria
    - Poorly controlled Gestational diabetes
    - Hyperthermia
    - Maternal Hypothyroidism
    - Placental insufficiency

•2. Postnatal onset

•Genetic

•Inborn errors of metabolism
•Congenital disorder of glycosylation
•Mitochondrial disorders
•Peroxisomal disorder
•Glucose transporter defect
•Menkes disease
•Amino acidopathies
•Organic acidemia

•Syndromes

•Contiguous gene deletion
•17p13.3 deletion (Miller–Dieker syndrome)
•Single gene defects
•Rett syndrome (primarily girls)
•Nijmegen breakage syndrome
•X-linked lissencephaly with abnormal genitalia
•Aicardi–Goutières syndrome
•Ataxia telangiectasia
•Cohen syndrome
•Cockayne syndrome

•Acquired

•Disruptive injuries

- Traumatic brain injury
- Hypoxic-ischemic encephalopathy
- Ischemic stroke
- Hemorrhagic stroke

•Infections

- Congenital HIV encephalopathy
- Meningitis
- Encephalitis

- Toxins
- Lead poisoning
- Chronic renal failure
- Deprivation
- Hypothyroidism
- Anemia
- Congenital heart disease
- Malnutrition

- Fatta eccezione per le **craniosinostosi** una circonferenza cranica piccola è legata ad un iposviluppo cerebrale
- Microcefalia primaria se si instaura nei primi 7 mesi di vita fetale
- Microcefalia secondaria se negli ultimi 2 mesi o nel periodo perinatale
